

SHORTCUT TO SERVICE

Bypassing our biggest bottleneck so solutions start sooner

Service waits on triage

Valuable time is spent routing rather than resolving. Before service teams can help, a Client Services agent must read, classify, and route the request

The requester emails askIT@yorku.ca, or the message is forwarded there

Halo records the new request

A triage agent identifies the intent

The agent selects the category and team

Often days later, the assigned team begins resolving the request

Delayed service

Every minute spent moving a ticket delays diagnosis, support, or resolution

Requests wait for a routing decision before reaching the people who can act

Manual classification can vary from person to person

Incomplete Duo requests create a repeat-contact loop and potentially hours of wait

Skilled agents spend scarce peak capacity moving routine work between queues

Queue delay

Variation

Back-and-forth

Capacity drain

Faster service

Every supported ticket classified with high confidence bypasses manual triage, returning time to service delivery

Supported tickets classified with high confidence move directly to the team that can act, so service starts sooner

Consistent logic, interpretation, and categorization are applied to every eligible request

Incomplete Duo requests receive an immediate request for missing information, reducing a wait that can currently last hours and creating an estimated 45% efficiency gain

Confidently routed in-scope tickets require no manual classification, freeing skilled agents for higher-value work

Direct routing

Consistent decisions

Automated follow-up

Capacity returned

Automated efficiency

Every incoming AskIT ticket is assessed. Only in-scope, high confidence tickets are auto-routed

Direct to resolvers

Direct to resolvers

Instant follow-up

Instant follow-up

Trusted fallback

Trusted fallback

Mitigating risk

The biggest risks remain the same whether a ticket is triaged automatically or manually. New risks have specific mitigations in place

Auto-route only with high confidence

Auto-route only with high confidence

- ? Launch scope is limited to categories with sufficient training data and demonstrated classification confidence
- ? Receiving teams can follow current Departmental Triage best practices to mitigate misrouted tickets
- ? Recurring patterns are reported and used to improve the model. Auto-routing is intended to reduce misrouting over time

Only hunt the white whale: Duo 2FA ?

Only hunt the white whale: Duo 2FA ?

- ? Send an automatic response only to Duo requests submitted from a York University email address
- ? Respond only when a Duo request is missing required information
- ? Halo sends approved text based on an AI trigger, not AI-generated free-form advice
- ? If the follow-up doesn't apply, a Client Services agent takes over and continues as usual

Dashboard for rapid response

Dashboard for rapid response

- ? Stalled tickets appear on the Otto Excellence dashboard
- ? The UIT Service Desk follows a simple recovery process

Better every day

Better every day

- ? During two weeks of silent production monitoring, we compare AI and agent decisions
- ? We only go live when monitoring meets the agreed readiness criteria
- ? Low-confidence and out-of-scope tickets stay in the human process
- ? Every day, we gain more and better data to fine-tune the solution

Rollout timeline

We test the solution in QA and PROD and set readiness gates before it updates or routes a ticket

Complete technical validation, UAT, guidance, frontline training, and operational readiness

Analyze live production tickets and record decisions without updating, assigning, or routing them

Assess accuracy, exceptions, operations, and people readiness before active routing

Supported tickets classified with high confidence begin to be routed automatically. All others follow normal triage August 31 is a target contingent on a successful monitoring period

Monitor metrics and stalled tickets, recover exceptions, and continue fine-tuning based on the results

Build, test, prepare

Monitoring phase begins

Readiness Gate

Active routing begins

Hypercare and refinement

Highest volume = highest value

Only the most frequently used categories are eligible

Uncertain decisions stay with the Service Desk

Two weeks of production data inform the decision

People remain responsible for exceptions, judgement and service quality

Who feels the change?

Requesters

Requesters

- ? Some requests reach the people who can help sooner
- ? Incomplete Duo requests may receive an automatic reply requesting missing information
- ? They continue to use the same service channels
- ? The same support staff will resolve their requests
- ? Respond to automatic follow-ups when requested

IT agents

IT agents

- ? Some tickets will be automatically routed to the following queues: CTS Classroom Operations ED&I Learning Technology Services UIT Service Desk Telecommunications
- ? Tickets may reach all queues faster than before, whether routed automatically or manually
- ? Current review, response, escalation, categorization, and resolution practices remain in place
- ? Monitor ticket queues early and often
- ? Follow Halo best practices , especially for handling misrouted tickets and verifying categorization before resolution
- ? Notify OpEx about persistent routing errors Raise an Incident to OpEx: Application > HaloITSM > Triage Agent Issue

UIT Service Desk

UIT Service Desk

- ? The Service Desk monitors and recovers stalled tickets
- ? Monitor the queue and Otto Excellence Dashboard
- ? Recover stalled tickets
- ? Less manual routing for confidently assessed in-scope ticket
- ? The Service Desk continues to triage low-confidence, out-of-scope, incomplete, and exceptional requests
- ? Avoid interrupting active Otto Excellence processing
- ? Notify OpEx about persistent routing or stalling errors
Raise an Incident to OpEx: Application > HaloITSM > Triage Agent Issue

IT leaders and managers

IT leaders and managers

- ? Leaders receive clearer operational evidence about routing performance, exceptions, and readiness
- ? Service ownership, escalation accountability, and human responsibility remain with people
- ? Reinforce expectations
- ? Confirm team readiness
- ? Support evidence-based tuning during peak

Prepare the Service Desk to...

With capacity freed from manual routing, the Service Desk will monitor Auto Triage and remediate issues

Recognize when Otto Excellence is actively processing and avoid interrupting Auto Triage

Check the IT Client Services queue and Otto Excellence Dashboard often

Confirm that a ticket is stalled, then triage it as usual

Record and report recurring errors, unusual trends, and repeated stalls, then notify Operational Excellence

Understand the process

Watch for issues

Route stalled tickets

Turn patterns into improvement

How it plays out

Major value with minimal disruption

First change advisory notifying IT staff of the Halo change and directing them to Auto Triage resources for more information

The monitoring phase begins, but nothing changes for agents or requesters

Second change advisory notifying IT staff of the planned move to active routing

Send IT agent communications with links to the IT agent guide . Begin Service Desk-specific training

Analyze and share the monitoring-phase data and confirm readiness for active routing

Activate and monitor auto-routing

Change Advisory 1

Begin monitoring

Change Advisory 2

Prepare agents

Confirm readiness

Launch

Prepare our people

Otto shuffles the tickets

We shift the culture

Herald Auto Triage and reinforce the message that it removes waiting and protects scarce capacity. It brings service closer to our community; it doesn't remove the people who deliver it

Confirm your teams understand the coming change and their roles in it. Direct them to the communications and resources being shared. I'll also send everyone a one-page reference after this meeting

This is the foundation of service automation. We need to hold the line through the early rollout, learn from every result, and build the operational discipline needed to scale automated routing and responses
